Xenometrics, LLC

Type: ROUTINE INSPECTION  
Date: Sep-15-2014

### 2.33 (b) (4)

#### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE.

\* At the time of inspection, macaques were being hand carried back to their primary enclosures after being sedated with ketamine. The animals had just completed a non-invasive ECG procedure performed by the primary investigator staff. The attending veterinarian stated that while recovering from sedation, animals are closely observed and primate squeeze cages are pulled forward far enough that the animals can easily lean on a wall if they lose balance. At the time of inspection, the caretaker returning the animals to their enclosures was not pulling the squeeze cages forward so the animals had unrestricted movements in their metal enclosures. Additionally, the caretaker was not closely observing the animals as they were recovering. Several minutes after a female macaque (#CP3103, DOB 2-7-2012) was returned to her enclosure, she stood upright, lost her balance, and fell to her side hitting her head on the floor of the enclosure. The same animal fell two more times within a couple minutes.

\*\* Until fully recovered from sedation, animals are at an increased risk for becoming injured or having a medical complication and should be handled and observed accordingly.

\*\*\* The registrant must ensure that the program of veterinary care includes guidance to principal investigators and other personnel involved in the care and use of animals regarding handling, immobilization, anesthesia, analgesia, tranquilization, and euthanasia.

\*\*\*\* TO BE CORRECTED BY: 26 September 2014

The inspection was conducted on 15-16 September 2014 with facility representatives. An exit interview was conducted on 19 September 2014 with facility representatives.
